### Technical Information

---

## **GAMATEX RDL**

---

Levelling agent for dyeing with reactive dyes on cellulosic fibres.

- Controls the exhaustion of reactive dyes during the adsorption phase because of improved dye distribution.
- Thanks to its pH-regulating effect, ensures uniform fixation of the dyes during the alkali addition.
- Sequesters, hardness-forming substances found in the works water, on the goods or even in electrolytes. (inbuilt sequesterent)
- Permits improvement of dyeing reproducibility.
- Increasing the solubility of the reactive dyes and thus maintaining the homogeneous dye bath through out the dye cycle.

### PROPERTIES

Appearance : Pale brown liquid with ammoniacal odour.

Ionic : Anionic.

pH of 1% solution : 6+/-1

### APPLICATIONS

RDL easily miscible in cold water. The diluted solution can be added 50% directly to the dye liquor and 50% along with the dyes dissolution.

The application amount is practically independent of the dye concentration. We recommend the addition of

0.5 - 1 g/l Gamatex RDL.

Increase the application amount 1g/l to 2 g/l Gamatex RDL in case of difficult dyeing conditions such as Substrates which are difficult to get level dyeing, Liquor ratio lower than 10:1, insufficiently precise alkali metering.
